

Part 10 – Creadify Claude Code Master Build Guide

1. Project Goal

Build a premium, conversion-focused, single-page marketing agency website for Creadify inspired by modern agency websites while maintaining a unique identity. Prioritize speed, accessibility, responsiveness, and business outcomes.

2. Recommended Tech Stack

Next.js (App Router), React, Tailwind CSS, TypeScript, GSAP or Framer Motion for animations, React Hook Form, Zod validation, Lucide Icons, and Vercel deployment.

3. Folder Structure

Use folders for app/pages, components, sections, layouts, hooks, lib, styles, public assets, animations, SEO, and utilities. Keep sections modular and reusable.

4. Component Hierarchy

Create reusable components: Header, Hero, LogoCloud, About, Services, Industries, Stats, CaseStudies, Process, Comparison, Testimonials, FAQ, CTA, Contact, Footer.

5. Design Tokens

Centralize colors, typography, spacing, border radius, shadows, breakpoints, z-index, and animation timings in a single configuration.

6. Responsive Rules

Desktop: 12-column grid. Tablet: 8-column grid. Mobile: single-column. Maintain consistent spacing using the 8px system.

7. Animation Implementation

Use entrance animations on scroll, staggered cards, animated counters, floating dashboard widgets, smooth scrolling, and subtle hover effects. Respect prefers-reduced-motion.

8. Performance

Optimize images, lazy-load non-critical assets, preload fonts, code split large components, defer analytics, and target Lighthouse scores above 95.

9. SEO Implementation

Implement semantic HTML, metadata, Open Graph tags, Schema.org markup, sitemap.xml, robots.txt, canonical URLs, and optimized alt text.

10. Accessibility

Ensure keyboard navigation, visible focus states, sufficient contrast, ARIA labels where needed, semantic headings, and accessible forms.

11. QA Checklist

Test responsiveness, navigation, forms, animations, performance, accessibility, SEO, broken links, browser compatibility, and Core Web Vitals before launch.

12. Claude Code Workflow

Build the website section-by-section. After each section, verify responsiveness, accessibility, animations, and visual consistency before moving to the next section.

13. Deployment

Deploy on Vercel with environment variables, analytics integrations, HTTPS, caching, compression, and continuous deployment from Git.

14. Future Enhancements

Add CMS integration, multilingual support, blog, client portal, scheduling, analytics dashboard, and A/B testing framework as the business grows.
