

Part 5 – Creadify Animations & Microinteractions

1. Motion Philosophy

Animations should communicate hierarchy, guide attention, and provide feedback. Keep motion subtle, purposeful, and performant.

2. Global Timing

Standard durations: 150ms (hover), 250ms (buttons), 400ms (cards), 600–800ms (section reveals). Use ease-out for entrances and ease-in-out for interactions.

3. Page Load

Hero content fades up sequentially: badge, headline, paragraph, CTAs, trust badges, then dashboard. Total load under 1.2 seconds.

4. Sticky Header

Transparent over hero. On scroll, transition to solid background with light blur and soft shadow over 250ms.

5. Hero Dashboard

Floating KPI cards drift gently (2–4px). Charts animate from zero values to current values. Avoid distracting loops.

6. Scroll Reveals

Sections fade up with 30–60px offset. Cards appear in staggered sequence (80–120ms delay between cards).

7. Hover States

Cards lift 6–8px with stronger shadow and accent border. Buttons slightly scale (1.02x) and brighten.

8. Statistics

Counters animate from 0 to target values over 2–3 seconds when entering the viewport.

9. Testimonials

Carousel slides smoothly with swipe support on mobile. Transition duration: ~500ms.

10. FAQ

Accordion expands/collapses smoothly with height animation and rotating chevron icon.

11. Contact Form

Inputs highlight on focus. Validation errors shake lightly once and display inline helper text. Success shows confirmation animation.

12. Mobile Motion

Reduce animation distance and complexity. Respect reduced-motion preferences. Prioritize responsiveness over decorative effects.

13. Performance Rules

Target 60 FPS. Prefer CSS transforms and opacity. Avoid animating layout properties such as width or top whenever possible.

14. Recommended Libraries

GSAP for advanced timelines, Framer Motion (React) for components, Lenis for smooth scrolling, and Lottie only for lightweight illustrations.
